Lab 7

Sentiment Analysis

Since our project is about mapping and identifying the inside of a building, I used the phrase "Where is the nearest exit". The code uses uClassify to get the sentiment results for the assigned phrase, and tells the user if the phrase is positive or negative. For the sample phrase, the returned results were:

```
The phrase 'Where is the nearest exit' is a negative phrase
```

I had to download the org.json library and import into the project to allow for parsing of the returned json object.

Recommendation

I was a little confused on what to do for this. What I ended up doing was creating random data for what clothing items users prefer from which stores (based on the idea that our project may be used to map a mall, and could provide directions to a user to the recommended store).
